

6. CONCLUSION

- The development of this Project includes so many roles like customers and supplier. It is very important to identify the system requirements by properly collecting required data to interact with the system. Proper design builds upon this foundation give a blue print, which is actually implemented in real life. On realizing the importance of the systematic documentation all the processes are implemented using a software engineering approach.
- While doing this project we faced many real time problems and learned how to tackle it smoothly. We have gained a lot of practical knowledge from this project, which we think, shall make us stand in a good state in the future.
